

GasBot2.0 was made to let people know the most economically efficient place to get gas from where they are, taking into consideration how many gas stations they want to cross check, the average mileage on their car, and how expensive the gas is at each station. It is also designed to have a good interface to talk to as a bot. When someone would like to crunch the data on where to get gas, they must use the console in which they compiled the program in. GasBot2.0 could make people spend less money and be more efficient when getting gas.
